

PowerTrack®

Mobile Workforce Solutions for Construction

Tear Up Your Timesheets!

Streamline operations and boost productivity by using PowerTrack mobile software to automate your paper reporting requirements. Using rugged handheld terminals, your supervisors can submit their daily field reporting data faster, easier and more accurately.

PowerTrack consists of a PC server application and client software running on Microsoft Windows Mobile remote devices, laptops or PC workstations. The system can be set up using a wireless network or WAN (such as Verizon or AT&T) for rapid data delivery, or with batch communications.

How it Works

Current employee, equipment, material and job information from the main office computer is automatically downloaded to your supervisors' remote devices. On the job, the

remote devices are used to quickly and accurately scan employee badges and equipment using bar codes or by selecting data from a scrollable list.

A transaction type is selected from a drop down menu on the remote devices, and the associated prompt buttons for that transaction type will display on the device. Using the integrated scanner, keypad, user-selectable lists or search functions on the remote device, data is entered for each prompt button. The supervisor can view and edit the posted transactions on the remote device before the data is transmitted to the PowerTrack server.

During data synchronization, the information collected in the field is uploaded to the server. New employee and job data, configuration changes, etc., are downloaded to the remote device.

PowerTrack is a versatile and easy-to-use program that replaces time-consuming and sometimes illegible paper reporting with a more accurate and reliable system.

Get the PowerTrack Edge!

- Use one device to collect daily reporting requirements
- Easy system setup – no programming required
- Unique configuration utility for user-definable transaction types, prompt titles and other settings
- Supports bar code scanning and signature capture
- Collect time data as durations, or real time – record start times and job changes as they occur
- Powerful transaction viewing and editing capabilities
- Integrates with any ODBC data source, including most job cost accounting systems
- Optional integrated GPS

Once the information is reviewed, PowerTrack can export the collected data to the company's job cost accounting package.

Set up and Configuration

Tailor the system to your unique operation using the configuration utility to define transaction types, prompt buttons and field names.

Enter optional control settings for each prompt button to:

- Define data entry methods
- Validate entered data with the remote device database
- Set required data entry fields
- Continue to display the same data value in a field after posting
- Auto-fill data
- Auto-post when all required fields are entered
- Allow unknown, non-validated data entry to be posted

Set time collection logic to collect time as either durations or real time. Real time collection records start times and durations as they occur.

Transaction Review

All transaction records uploaded from the remote device to the PowerTrack server may be reviewed and edited using PowerTrack Approval Processing. Filtering records for viewing by transaction type and by field allow for a variety of ways to analyze data. Selected records are displayed and may be edited or deleted.

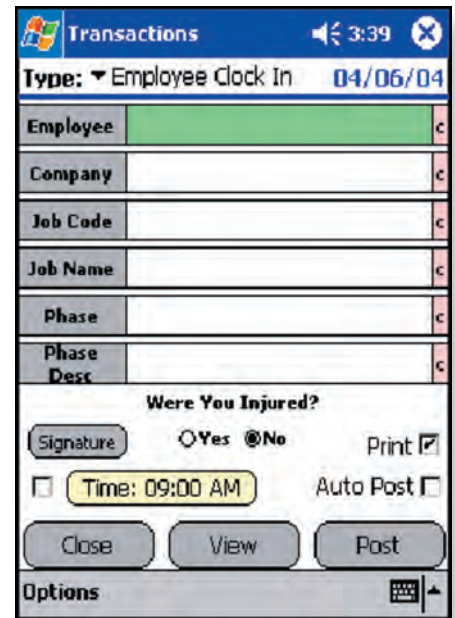

Any Approval screen also can be printed as a report. Custom reports can be integrated into the PowerTrack system.

Software Integration

The PowerTrack software easily integrates with existing accounting systems. To keep all information current, PowerTrack automatically syncs with the accounting system's database. PowerTrack sends approved transaction information either directly to the accounting system's database, or to a text file for later upload.

PowerTrack PC Client

PowerTrack PC Client software offers PC users access to all the functionality available on the mobile device, with a similar look and feel.

Transaction types, prompt buttons and field names are easy to configure to your unique needs. Customizable screens are simple to navigate and require little training or prior computer experience to use.

About Compsee

Compsee., a division of Control Solutions, Inc., is a national leading Auto ID systems integrator, specializing in tracking software solutions. Visit our website to see how construction companies like yours are lowering costs and improving accuracy with PowerTrack.

What our customers say...

Eliminates manual data entry

"PowerTrack eliminates the need to manually enter timecards and equipment usage data into the accounting system and improves the accuracy of information, which can be used to leverage more competitive bids in the future."

Bob Gower, Central PreMix, Spokane, WA

Easy to integrate into our workflow

"We were delighted with the ease of integrating PowerTrack into our workflow. Furthermore, we can see the potential for additional PowerTrack uses as we grow and develop."

Jared Faulkner, J.F. Electric, Edwardsville, IL

It's a better way: PowerTrack pays off

"We are a growing company that needed a better way of collecting man-hours. PowerTrack pays off because we spend far less time on data entry and on fixing mistakes."

Windie Ruprecht, Tedesco Construction, Reno, NV
